

Sub-processor Schedule — Off-chain Linkage Database Provider

This schedule governs processing carried out by the operator’s designated **Off-chain Linkage Database Provider** (the party hosting the reconciling authority data store). It is incorporated by reference into the Shyware Data Processing Agreement (`DATA_PROCESSING_AGREEMENT.tex`) and is published at <https://shyware.fyi/legal/privacy/dpia/dpa/schedule-database>.

Configuration trigger: All deployments. The reconciling authority data store is required for any non-write-only deployment posture (`deployment.default_posture: recoverable`).

Role Definition

Field	Value
Sub-processor role	Off-chain linkage database (reconciling authority data store)
Named provider	<code>REQUIRED_OPERATOR_INPUT</code>
Location	<code>REQUIRED_OPERATOR_INPUT</code>
Transfer mechanism	<code>REQUIRED_OPERATOR_INPUT</code> (EEA providers may qualify under adequacy)
Data processed	Off-chain linkage records mapping identity hashes to submission receipts; sealer-key mappings for sealed payloads; reconcile-surface audit logs

Structural Constraints

- **No global scan:** The database provider must not expose a global scan, bulk export, or enumeration API over reconciling authority data. The reconciling authority API enforces per-participant, identity-gated retrieval only. The database provider’s infrastructure must not bypass this constraint through direct database access tools or support workflows.
- **Three-authority linkage:** The database holds the off-chain linkage that, combined with the verification provider’s attestation records and the eligibility authority’s co-signature, enables payload decryption for Art. 15/17 workflows. This is the legitimate reconciling authority function — it requires all-party coordination and is not a unilateral capability.
- **Art. 17 erasure atomicity:** Sealer-key deletion is permanent and irrecoverable. The database provider must implement deletion atomically with the audit log entry. Failed or partial deletions must be retried; silent failures are a compliance breach.
- **No write to canonical state:** The database provider does not write to the canonical two-list ledger. It holds only the off-chain supplement.

Retention Configuration

Configure via `shyconfig.json`:

```
"retention": {  
  "off_chain_linkage_days": 730,  
  "deletion_cron": "0 2 * * *",  
  "basis": "contract performance - 2 years post-close"  
}
```

The database provider must enforce the configured deletion schedule. Operational enforcement of the cron schedule is a governance obligation; it is not verifiable by unit assertions alone.

Operator Obligations

- Execute signed DPA with the database provider before processing
- Document provider name, location, and transfer mechanism in the Records of Processing (`generate-rop.mjs`)
- Configure `retention.off_chain_linkage_days` and `deletion_cron` in `shyconfig.json`
- Verify the provider does not expose bulk scan APIs through support or internal tooling
- Confirm Art. 17 erasure atomicity is contractually required in the provider DPA
- Notify Shyware of provider changes at least 30 days in advance

This schedule is incorporated by reference into the Shyware Data Processing Agreement and is published at <https://shyware.fyi/legal/privacy/dpia/dpa/schedule-database>. Swap by replacing the database provider and updating the Records of Processing before migrating data.
